### HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

**Detailed Action**

**Examiner's Amendment/Reasons for Allowance**

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Jeffery W. Gluck on 12/30/2010.

**In the Claims**

In the first line of claim 92, the term "the system according to claim 47" is changed to "the process according to claim 47". Also, claim 91 is cancelled.

**Allowable Subject Matter**

Claims 47-49, 51-90 and 92 are allowed over prior art of record. The following is an examiner's statement of reasons for allowance:

The art of record did not teach or suggest the claim taken as a whole and particular the limitation pertaining to the "generating complementary information including modified information from the original stream, the complementary information also including one or more functions for reconstructing the original stream with the modified information, wherein a respective one of the one or more functions contains at least one instruction relating data associated with the complementary information and/or the modified stream and one or more operators associated with reconstructing the original stream from the modified stream; and separately transmitting the modified stream and the complementary information to an addressee equipment for reconstruction of the original stream from the modified stream and the complementary information, wherein the reconstruction is adaptive and progressive as a function of information associated with a digital profile of the addressee equipment provided in the complementary information".

With respect to independent claim 47; Ottesen et al show in fig.1 and disclose that

Module 120 modifies data from a base-domain source to add one or more markers for later restoration of the original image, col.4, lines 65-67, col.5, lines 1-9. Also, fig.1 shows that the modified stream and the complementary data are outputted from the transform module 130 at ports 131 and 132 respectively; disclose the base-domain value can be represented as a high-valued delta function at the marker location. This can be implemented by adding the argument value of the delta function to each of the components of the image data in the transform domain,col.10, lines 12-40;col.11, lines 55-67; col.12, lines 1-19.

And Dallard Each PECM is preferably delivered to end-user client 390 a defined period of time before display of the relevant encrypted portion of the transport stream is performed, col.10, lines 57-67; all required PECM(s) could optionally be sent at once, before the encrypted content is transmitted,col.11, lines 58-67, col.12, lines 1-4; col.10, lines 46-56; the PECM therefore preferably contains information which is sufficient for the end user client to access the encrypted content, col.5, lines 44-54.

And Malvar et al disclose includes a method for decompressing a compressed bitstream by using adaptive run-length decoding to obtain transform coefficients from the compressed bitstream, rearranging the coefficients into their original order, and using an inverse DCT transform and an inverse LBT to obtain the reconstructed image data from the decoded coefficients,0016; allows progressive image reconstruction, both in resolution and in fidelity, with a fully embedded bitstream,0042; an image that has been encoded at a certain fidelity may be decoded at a lower fidelity, thereby allowing, for example, a server to distribute different versions of the same encoded image to different clients having different capabilities,0101.

But Ottesen in view of Dallard further in view of Malvar and any of cited references did not teach or suggest, alone or in combination the feature of “generating complementary information including modified information from the original stream, the complementary information also including one or more functions for reconstructing the

original stream with the modified information, wherein a respective one of the one or more functions contains at least one instruction relating data associated with the complementary information and/or the modified stream and one or more operators associated with reconstructing the original stream from the modified stream; and separately transmitting the modified stream and the complementary information to an addressee equipment for reconstruction of the original stream from the modified stream and the complementary information, wherein the reconstruction is adaptive and progressive as a function of information associated with a digital profile of the addressee equipment provided in the complementary information" as recited in combination with other features of independent claim 47.

The dependent claims 48-49 and 51-90 and 92 are allowed because are further limit independent/parents claims.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

***Conclusion***

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Malvar et al (20040234147) disclose a system and method for progressively transform coding digital data.

Ottesen et al (6873744) disclose Image restoration from transformed component data.

Stone et al (20020118859) disclose Embedded data in material.

Zhang et al (7321625) disclose Wavelet based multi-resolution video representation with spatially scalable motion vectors.

Sasaki et al (6735699) disclose Method and system for monitoring use of digital work. a method and an apparatus for creating a television viewer profile.

Shin et al (6415042) disclose digital image coding/decoding apparatus and method for evaluating the quality of images transmitted using watermarking.

Dallard et al (7333610) disclose System and method for pre-encryption of transmitted content.
